

From reported outcome labels to synthesis-ready outcome constructs

Cardiovascular intervention trials

Different wording → same construct

“3-point MACE” [1]

“Composite of CV death, MI, or stroke” [2]

Major adverse cardiovascular events

Glycemic control trials

Different wording → same construct

“Reduction in HbA1c levels” [5]

“Change in glycosylated hemoglobin (HbA1c)” [6]

HbA1c change from baseline

Treatment-related harm outcomes

Different wording → same construct

“Grade 3 or higher treatment-related AEs” [9]

“AEs of grade 3–5, related to treatment” [10]

Grade ≥3 treatment-related adverse events

Similar wording → different constructs

“All-cause mortality, 30 days” [3]

“All-cause mortality, 1 year” [4]

different follow-up windows

Similar wording → different constructs

“Fasting blood glucose” [7]

“Postprandial blood glucose (AUC)” [8]

different measurement timing

Similar wording → different constructs

“Serious adverse events (SAEs)” [11]

“Grade ≥3 adverse events, all-cause” [12]

seriousness ≠ severity grade

→ mapped to a common construct

✗ kept as distinct constructs
